Hi.

If you're holding this, you've heard at least some version of what this book is about to say. You may have been there for the Whole Foods meltdown. You may have read one of the four manuscripts I gave up on. You may have endured an Allan Savory anecdote. I might have talked to you, ad nauseum, about camels.

You may know an unfiltered version of me. (No, you definitely do if you are holding this book.) However, this is the cleaner version. A polished version. Fourteen years and five restarts later, I figured out what I was actually trying to say. The argument, in two words: *survivability matters*. The longer version is the four-axis framework I built to make the case. The book applies it to every food system worth evaluating, ends up at a hundred camels in an osage orange orchard, and asks whether the ground can be flipped.

I think it can — *but I have been wrong before.*

You're going to hear about my mistakes. Times I was too cocksure of myself, and standing on top of Dunning-Kruger's Mount Stupid.

If you read it and tell me what you think, that is the most useful thing you could do with this copy. If you stop, tell me where. If you disagree, come fight me.

— KP
